

Upgrading to Microsoft Office SharePoint Server 2007

SharePoint 2007 offers a host of new features and upgrades, including significant performance and scalability improvements, as well as improved options for authentication. Smoothly upgrade to SharePoint 2007 with Catapult Systems' expertise. We use our vast SharePoint implementation experience to help you bypass potential pitfalls, enabling your organization to make the transition quickly and easily. Rely on Catapult to help your organization take advantage of:

Enhanced SharePoint features

- A single indexing and search infrastructure scales from the desktop, through team sites and divisional portal sites, to the largest corporate intranets, extranets and Internet sites
- Rights-trimmed user interface allows users to see only features they have the rights to use
- Alerts may be customized and filtered to be more relevant
- User interface is more uniform and includes more descriptive menus and breadcrumbs
- Event Handler Model allows developers to extend and enhance the product
- Metadata properties for a list or document library are enhanced and globally controlled
- Major and minor document versioning
- People Search allows users to find people by department or job title, expertise, social distance and common interests
- Item-level security or granular security

New SharePoint features

- Ready-to-use workflow templates, and customized workflow solutions, enable workflow for document library and list items
- Web content management, including content authoring with site templates, content approval and feedback
- Templates for specific processes or sets of tasks to enable quick implementation of business application project sites
- Web-based InfoPath Forms Server for browser-based forms with templates and centralizes forms management and control
- KPIs and Excel Server Spreadsheets can be securely published to SharePoint sites from multiple sources
- Off-line files management and synchronization with Outlook
- The Business Data Catalog integrates external data into SharePoint, providing access to data in back-end applications
- Inbound email handler allows email addresses to be assigned to document libraries enabling emails and files to be automatically delivered to workgroups
- RSS feeds provide an efficient mechanism for end-users to retrieve information using RSS-enabled programs
- The Recycle Bin enables users to easily restore an item that was deleted accidentally and provides administration tools to manage the lifecycle of deleted items
- Content types define and implement business documents such as functional specifications or a budget planning spreadsheet
- Social Networking uses information about your organization, communities and electronic communications to help establish connections between colleagues with common interests.

The Catapult Systems SharePoint Upgrade Approach

Planning	Catapult reviews how your organization uses SharePoint 2003 and helps you understand how an upgrade will impact it. We also help your organization identify ways that the system's new features can be leveraged within your organization.
Upgrade and Platform Changes	We help your organization understand what changes will need to occur in your environment, including the changes to the server farm, topology and capacity.
Phased Rollout	Catapult has developed custom Web Parts that make the rollout easier for both your IT organization and your users, by enabling users to upgrade when it is most convenient for them.
Education	We will train and mentor the system administrator, as well as teach your IT organization about the new features of SharePoint 2007, how they can be used and how you can roll them out to your organization. We can also assist you in marketing the changes inside your organization to increase the user acceptance rate.
